

Directional spool valves, direct operated, with solenoid actuation

Type WE ...XE

RE 23178-XE Edition: 2016-04

Replaces: 09.13

Features

- ▶ 4/3-, 4/2- or 3/2-way version
- ► For intended use in potentially explosive atmosphere
- ▶ Porting pattern according to ISO 4401-03-02-0-05
- ▶ Wet-pin DC or AC solenoids
- Electrical connection with individual connection and cable gland
- With manual override, optional

- ► Size 6
- ► Component series 5X
- ► Maximum operating pressure 350 bar
- ▶ Maximum flow 70 l/min

ATEX units

For potentially explosive atmospheres

CE

- Area of application in accordance with the Explosion Protection Directive 2014/34/EU: II 2G
 Type of protection of the valve solenoids:

	For details of electrical connections, see page 14	
12	Without throttle insert	no code
	Throttle Ø 0.8 mm	B08
	Throttle Ø 1.0 mm	B10
	Throttle Ø 1.2 mm	B12

Use with flows which exceed the performance limit of the valve (see page 5)

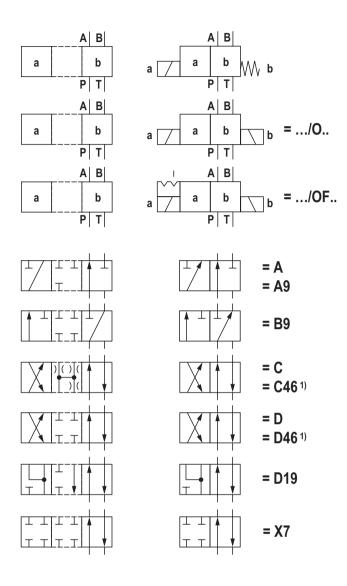

Seal material

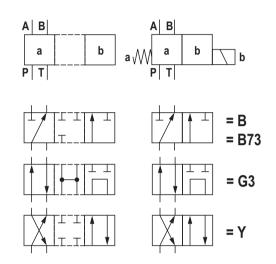

13	NBR seals	no code				
	FKM seals	V				
	Observe compatibility of seals with hydraulic fluid used. (Other seals upon request)					

Notice:

The manual override cannot be allocated a safety function and may only be used up to a tank pressure of 50 bar.

Symbols: 2 spool positions

 For valves with AC solenoids and detent, only C46/OF and D46/OF are admissible.

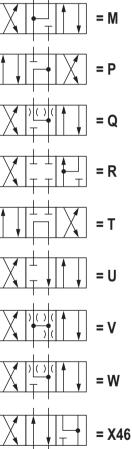

If Notice:

Representation according to DIN ISO 1219-1. Hydraulic interim positions are shown by dashes.

Symbols: 3 spool positions

= L

²⁾ Example:

- Symbol E with switching position "a" ordering code ..EA..
- ³⁾ Symbol E1-: P A/B pre-opening,

Caution in conjunction with differential cylinders due to pressure intensification

Notices:

Representation according to DIN ISO 1219-1. Hydraulic interim positions are shown by dashes.

Function, section

Directional valves of type WE are solenoid-actuated directional spool valves. They control start, stop and direction of a flow.

The directional valves basically consist of housing (1), one or two solenoids (2), control spool (3), and one or two return springs (4).

In the de-energized condition, control spool (3) is held in the central position or in the initial position by the return springs (4) (except for impulse spool). The control spool (3) is actuated by wet-pin solenoids (2).

To ensure proper functioning, care must be taken that the pressure chamber of the solenoid is filled with oil. The force of solenoid (2) acts via plunger (5) on control spool (3) and pushes the latter from its rest position to the required end position. This enables the necessary direction of flow from $P \rightarrow A$ and $B \rightarrow T$ or $P \rightarrow B$ and $A \rightarrow T$.

After solenoid (2) was de-excitated, the return spring (4) pushes control spool (3) back to its rest position. A manual override (6) allows control spool (3) to be moved without solenoid energization.

Without spring return "O" (only possible with symbols A, C and D)

This version is a directional valve with two spool positions and two solenoids without detent. In the de-energized condition, there is no defined spool position.

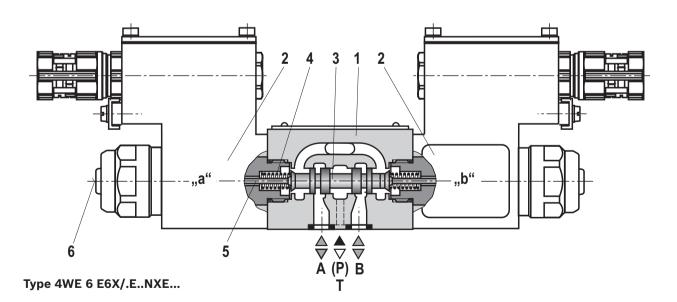

With spring return "OF" (impulse spool, only possible with symbols A, C and D)

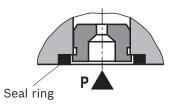

This version is a directional valve with two spool positions, two solenoids and one detent. It alternately locks the two spool positions and the solenoid therefore does not need to be permanently energized.

IF Notice:

Pressure peaks in the tank line to two or several valves can result in unintended movements of the control spool in case of valves with detent. We therefore recommend that separate return lines be provided or a check valve installed in the tank line.

For design reasons, internal leakage is inherent to the valves, which may increase over the life cycle.

Throttle insert "....B"

The use of a throttle insert is required when, due to prevailing operating conditions, flows occur during the switching processes, which exceed the performance limit of the valve.

Technical data

Important information on hydraulic fluids:

► For further information and data on the use of other hydraulic fluids, please refer to the data sheets above or contact us!

• There may be limitations regarding the technical valve data (temperature, pressure range, life cycle, maintenance intervals, etc.)!

- Pressure pre-loading at the tank port > 20 % of the pressure differential, otherwise increased cavitation
 - Life cycle as compared to operation with mineral oil HL, HLP 50 ... 100 %

- Maximum pressure differential per control edge 50 bar

▶ Ignition temperature > 180 °C

1) Observe the "Special application conditions for safe application" on page 7.

2) The cleanliness classes specified for the components must be adhered to in hydraulic systems. Effective filtration prevents faults and at the same time increases the life cycle of the components.

For the selection of the filters, see www.boschrexroth.com/filter.

Type examination certificate Solenoid	KEMA 02ATEX2240 X
"IECEx Certificate of Conformity" solenoid	IECEX DEK 12.0068X
Special application conditions for safe application	 In case of valves with two solenoids, maximally one of the solenoids may be energized at a time. Simultaneous power supply of several valves in bank assembly is possible if the ambient temperature does not exceed 60 °C. In case of bank assembly, if only one of the solenoids is energized at a time, and during individual operation, the maximum ambient temperature may not exceed 70 °C. The maximum temperature of the surface of the valve jacket is 120 °C. This has to be considered when selecting the connection cable and/or contact of the connection cable with the surface of the jacket is to be prevented.
Ambient temperature range	°C -20 +70 ⁵)

- ³⁾ The switching times were determined at a hydraulic fluid temperature of 40 °C and a viscosity of 46 cSt. Deviating hydraulic fluid temperatures can result in different switching times! Switching times change dependent on operating time and application conditions.
- ⁴⁾ Surface temperature > 50 °C, provide contact protection
- 5) Observe the "Special application conditions for safe application" in the above table.

Performance limits: Version "G24" (measured with HLP46, **9**_{0il} = 40 ± 5 °C)

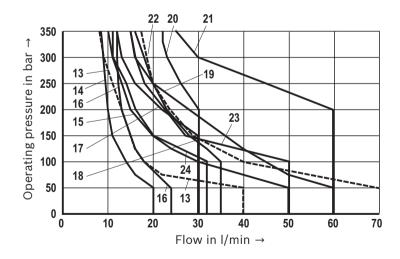

Notice:

The specified performance limits are valid for use with two directions of flow (e. g. from $P \rightarrow A$ and simultaneous return flow from B to T). Due to the flow forces acting within the valves, the admissible performance limit may be considerably lower with only one direction of flow (e. g. from $P \rightarrow A$ while port B is blocked)! In such cases, please consult us! The performance limits were determined when the

solenoids were at operating temperature, at 10 % undervoltage and without tank preloading.

Dimensions

(dimensions in mm)

Required surface quality of the valve contact surface

- 1 Name plate
- 2 Identical seal rings for ports A, B, P, T
- 3 Plug screw for valves with one solenoid
- 4 Mounting nut with hexagon, wrench size 32 tightening torque M_A = 4⁺¹ Nm
- Porting pattern according to ISO 4401-03-02-0-05 (with locating hole for locking pin ISO 8752-3x8-St, material no. R900005694, separate order)
- 6 Space required to remove the solenoid coil

Valve mounting screws (separate order) For reasons of stability, exclusively use the following valve mounting screws:

4 hexagon socket head cap screws ISO 4762 - M5 x 50 - 10.9-flZn-240h-L (friction coefficient μ_{total} = 0.09 to 0.14); tightening torque M_{A} = 7 Nm ± 10 %, material no. **R913000064**

Subplates (separate order) with porting pattern according to ISO 4401-03-02-0-05, see data sheet 45100.

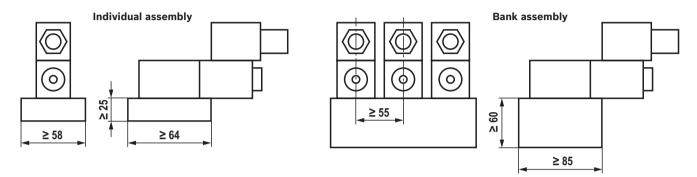

Notice:

Subplates are no components in the sense of directive 2014/34/EU and can be used after the manufacturer of the overall system has conducted an assessment of the risk of ignition. The "G...J3" versions are free from aluminum and/or magnesium and galvanized.

Installation conditions

(dimensions in mm)

	Individual assembly	Bank assembly
Subplate dimensions	Minimum dimensions Length ≥ 64, width ≥ 58, height ≥ 25	Minimum cross-section Height ≥ 60, width ≥ 85
Thermal conductivity of the subplate	≥ 38 W/mK (E	N-GJS-500-7)
Minimum distance between the longitudinal valve axes	≥ 55	mm

If Notice:

Observe the "Special application conditions for safe application" on page 7.

Electrical connection

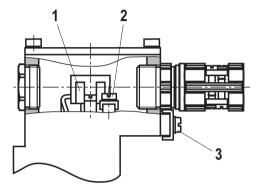

The type-examination tested valve solenoid of the valve is equipped with one terminal box and a type-tested cable entry.

The connection is polarity-independent.

Solenoids to be connected to AC voltage are equipped with an integrated rectifier.

Notice:

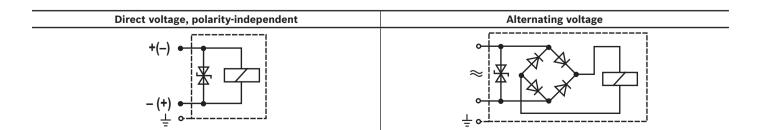

When establishing the electrical connection, the protective earthing conductor (PE $\stackrel{\perp}{=}$) has to be connected properly.

Properties of the connection terminals and mounting elements

Position	Function	Connectable line cross-section
1	Operating voltage connection	Single-wire 0.75 2.5 mm ² Finely stranded 0.75 1.5 mm ²
2	Connection for protective earthing conductor	Single-wire max. 2.5 mm ² Finely stranded max. 1.5 mm ²
3	Connection for potential equalization conductor	Single-wire 4 6 mm ² Finely stranded min. 4 mm ²

Over-current fuse and switch-off voltage peaks

Notice:

A fuse which corresponds to the rated current according to DIN 41571 and EN / IEC 60127 has to be connected upstream of every valve solenoid (max. 3 x I_{rated}).

The shut-off threshold of the fuse has to match the prospective short-circuit current of the supply source.

The prospective short-circuit current of the supply source may amount to a maximum of 1500 A.

This fuse may only be installed outside the potentially explosive atmosphere or must be of an explosion-proof design. When inductivities are switched off, voltage peaks result which may cause faults in the connected control electronics. The voltage peak must be damped by a suitable external circuitry. We recommend a circuitry with a suppressor diode with a limitation voltage of approx. 50 V.
