

**MANNESMANN
REXROTH****Press module, type L****RE
63 138/01.92**

Up to 4500 L/min

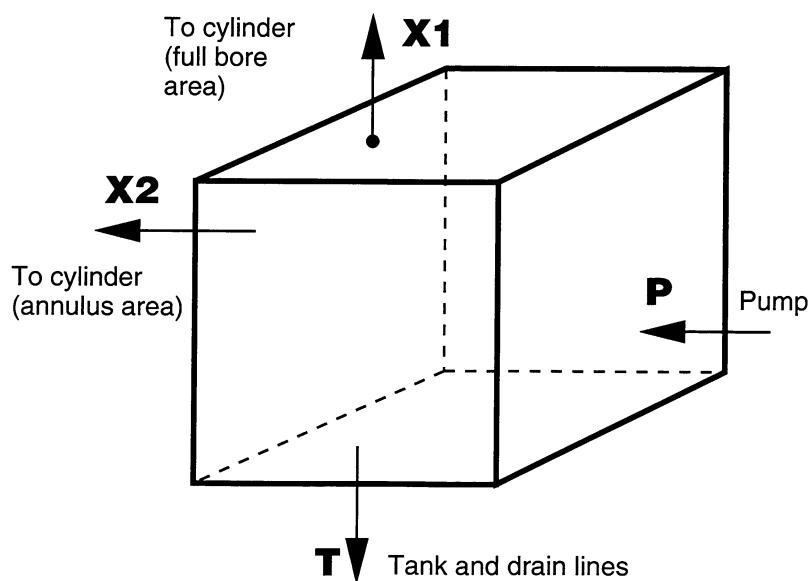

Up to 315 bar

Features

- The controls do not comply with the German safety regulations.
- All the valves are mounted onto or inserted into the manifold.
- Piping is only required to the actuators, pump and tank.
- Control design is clear.
- The surface mounted and inserted valves are easily accessible.
- Controls are tested as standard.

General

The press circuit is completely mounted on a manifold. All devices are installed so that they are easily accessible and are coded with item numbers.

The function of the press control may be deduced from the schematic diagram which follows.

Installation specification

The press module should be mounted as closely as possible to the cylinder. The installation position is optional, but the 4/2-way directional valves should preferably lie horizontally. The pipe between the manifold and the cylinder must be designed for the max. setting pressure of the pressure relief valves.

All port codes are stamped into the manifold. The ports must be piped in accordance with the hydraulic circuit.

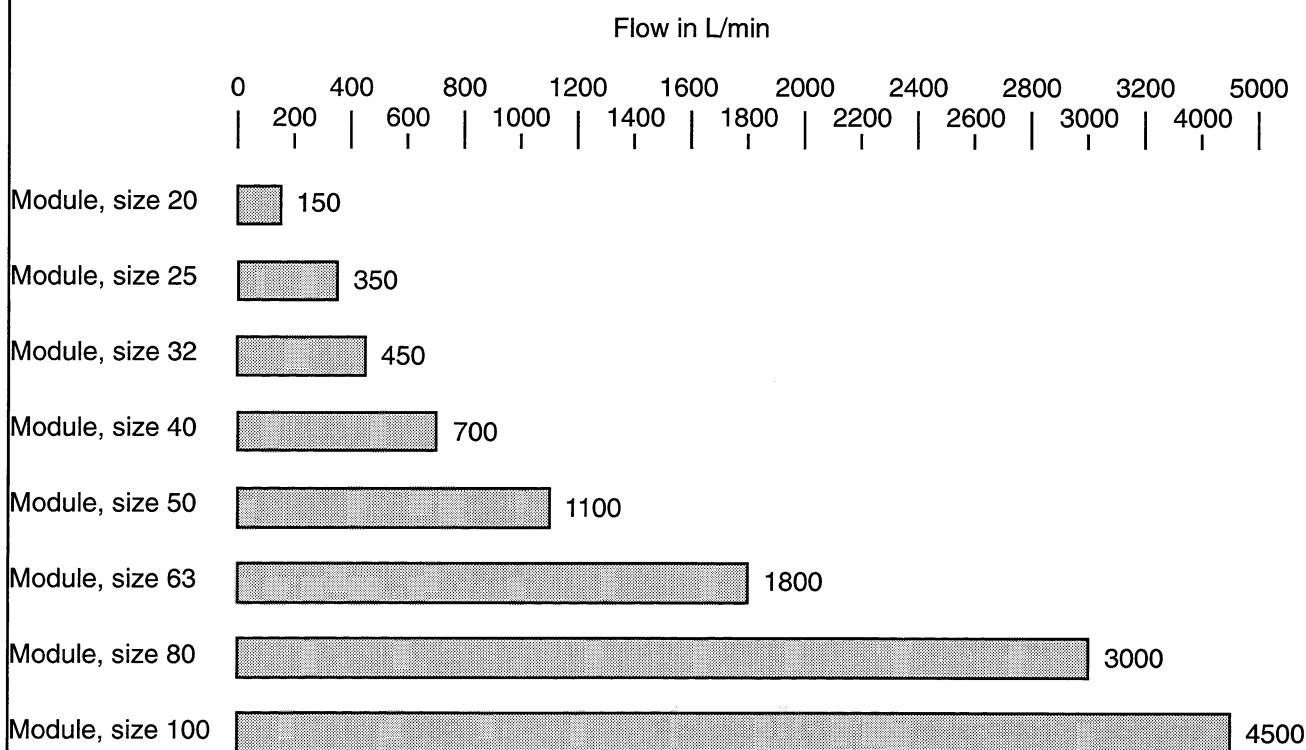

The screw plugs on the manifold, which do not have a port code must not be removed.

The following commissioning and service notes must be taken into account as necessary:

- RE 07 080 Commissioning, operation and servicing of hydraulic pumps and hydraulic motors
- RE 07 100 Commissioning, operation and servicing of hydraulic cylinders
- RE 07 300 Commissioning and servicing of hydraulic open loop and closed loop control devices
- RE 07 900 Commissioning and servicing of hydraulic systems.

Technical data: general and hydraulic (For operation outside these parameters, please consult us!)

Installation position	Optional, preferably horizontal								
Ambient temperature range °C	–20 to +50								
Fluid	Mineral oils (HL, HLP) to DIN 51 524, other fluids on enquiry								
Fluid temperature range °C	–20 to +80								
Viscosity range mm ² /s	2,8 to 500								
Fluid cleanliness	Maximum permissible degree of contamination of fluid to NAS 1638 Class 9. We therefore recommend a filter with a minimum retention rate of $\beta_{10} \geq 75$.								
Operating pressure bar									
Port: P, X1, X1.1, X2, X3, X4	Up to 315								
T	Up to 16								
Y	Low pressure to tank								
Size of module	20	25	32	40	50	63	80	100	
Max. flow L/min	150	350	450	700	1100	1800	3000	4500	

Flow through press modules

Maximum flow from annulus chamber of cylinder to port X2 to T and from hydraulic pump to port P to X1.

Example for sizes 20 to 100

Press module
Circuit type L

Description and function of valves in press moduleL100D2X/...,**Size 20 to 100****Prerequisite for application**

- Rapid approach under weight of parts,
- Minimum holding pressure 15 bar.

Pressure limiting of pump and low pressure bypass

The pump is pressure limited by means of the 2-way cartridge valve (items .030 and .032). The max. operating pressure is set at the pressure relief valve, which is built into the control cover (item .032) as a pilot valve. When the directional valve (item .034) is at rest the 2-way cartridge valve (item .030) is open and the pump only delivers oil against the closing spring to tank of the valve.

Press force, remote control - X3

The press force may be separately set by means of a remote control valve which is connected to port X3.

Control of direction of the press ram

Items .080 and .081 act as an intake valve for the process "pressing".

Items .070 and .071 act as an inlet valve for lifting (return) of the plunger to its initial position.

Directional valve (item .020 – symbol "D") ensures that the inlet valve for pressing is kept closed when it is at rest. The 2-way cartridge valve (item .070), inlet valve for the return, is open. It is only pushed into its seat by the force of the closing spring of item .071.

This means that only one press module may be connected to the main pump.

Rapid traverse – down

The energising of solenoids Y1 and Y2a cause the pilot oil chamber of the 2-way cartridge valve (item .060) to unload so that oil is able to flow to tank. Max. velocity is set by the stroke limiter on item .061.

Rapid traverse – end

Solenoid Y1 is de-energised and the 2-way cartridge valve (item .060) is closed with the pressure which was set at the pressure relief valve (item .062). This means that the value of the pressure set determines whether the plunger is decelerated harshly or gently to the press velocity. The deceleration pressure, set at item .062 must be set higher than the holding pressure. The holding pressure including the pressure limit for weight compensation is set at pressure relief valve (item .052).

During the deceleration phase from rapid traverse into press velocity the 2-way cartridge valve (item .060) is closed. Dependent on the increasing deceleration pressure and the unloading of the pilot oil chamber via item .052, the 2-way cartridge valve (item .050) opens without spool overlap occurring.

Pressing

The cylinder carries out the pressing stroke under pressure due to the pressure relief valve (item .052). The max. press velocity is set by the stroke limit of item .051, except in the case of module, size 20 where it is set by the throttle of item .050.

Decompression

After pressing has been carried out, decompression of the system takes place by means of the 2-way cartridge valve (items .090 and .091). The decompression time is set by the stroke limit of the control cover (item .091).

The pressure relief valve (item .780) is set 10% higher than the max. operating pressure and wire locked.

Return

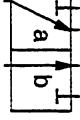

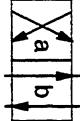

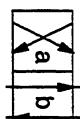

Energising of solenoid Y3 and de-energising of Y2a. The pump delivers oil to the annulus chamber of the cylinder and the press lifts. The oil from the full bore of the cylinder flows via the prefill valve to tank.

Port X4 is normally closed. If no pilot pump is available, the prefill valve may be controlled via X4.

If the return pressure is allowed to be higher than the pressing pressure set at the remote control valve, then (and only then) is the tank line of the remote control valve connected to port X4.

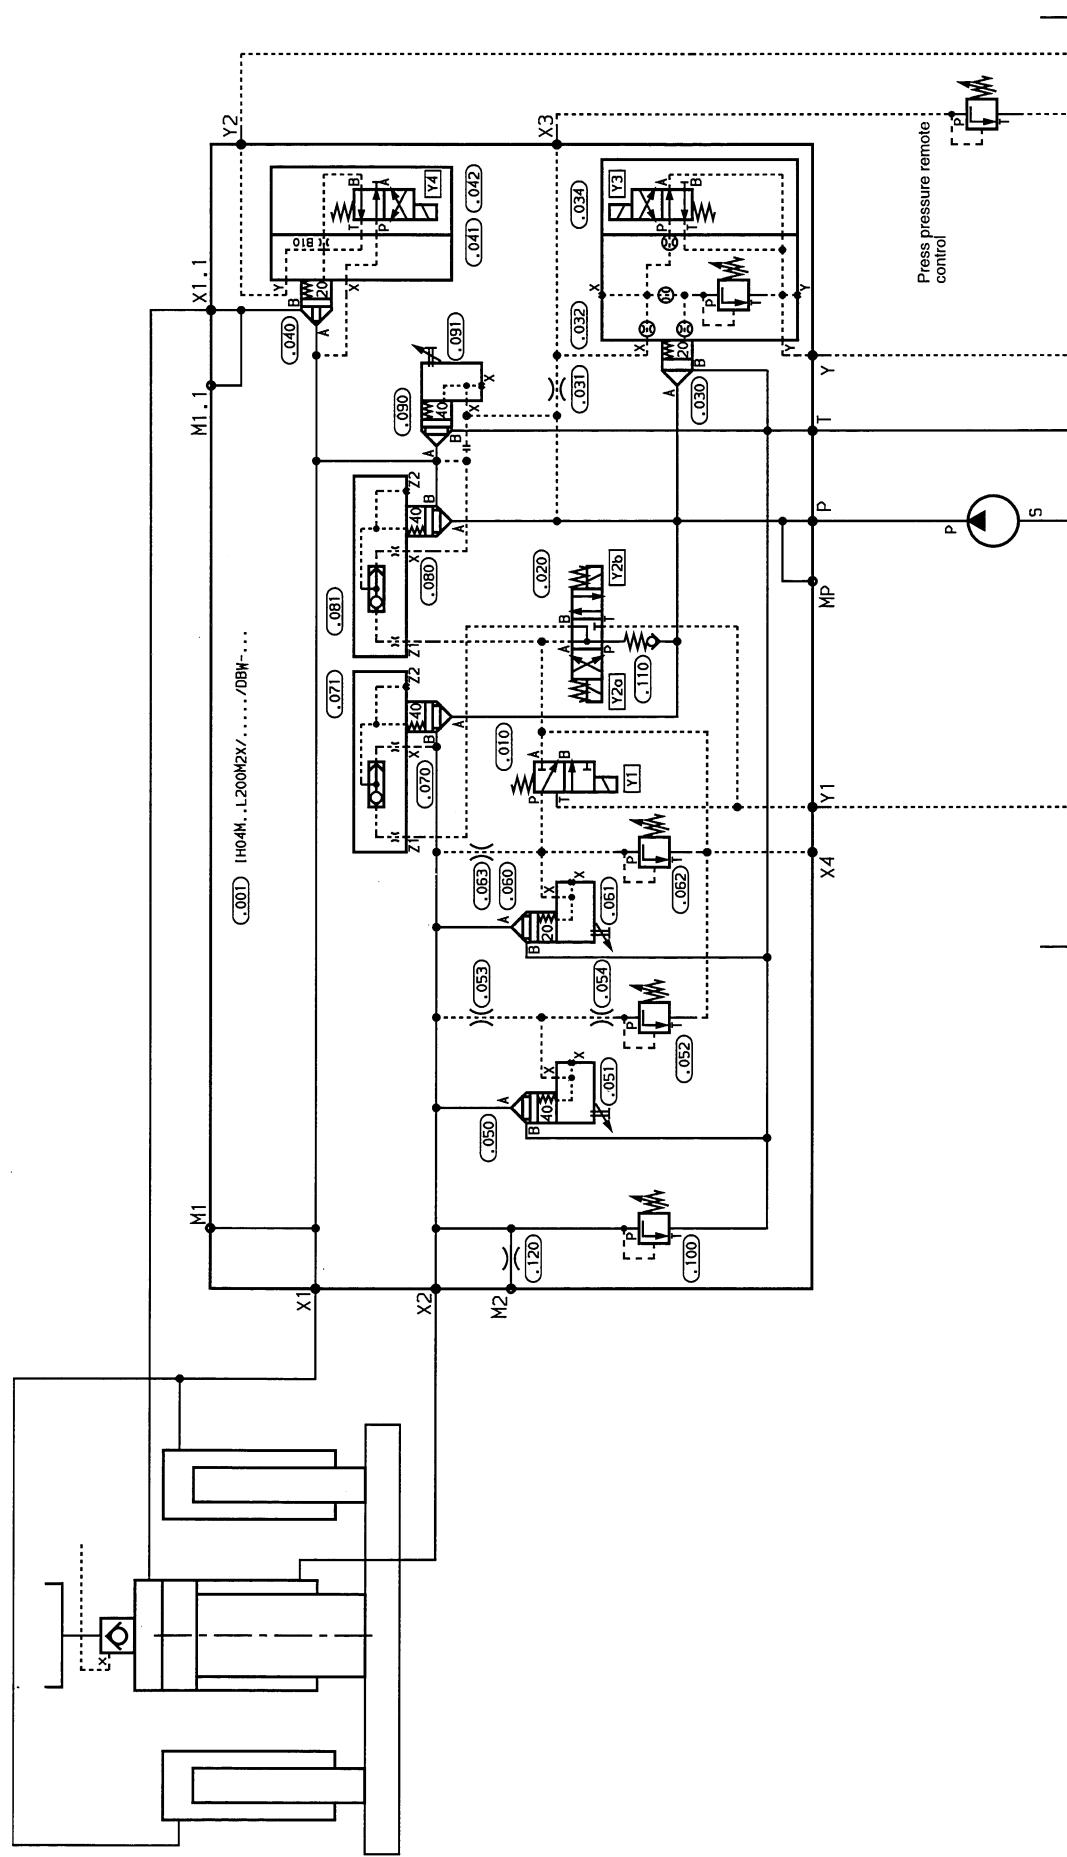

The pressure relief valve (item .100) used for limiting the annulus pressure is set 10% higher than the max. operating pressure and wire locked.

Pressure relief valve	Y2a	.020						
	Y3	.034						

Example for sizes 20 to 100

Press module
Circuit type L

Description and funktion of valves in press module ...L200M2X/...,**Size 20 to 100****Prerequisite for application**

- Rapid approach under weight of parts is not possible
- Rapid traverse by means of rapid traverse cylinder

Pressure limiting of pump and low pressure bypass

The pump is pressure limited by means of the 2-way cartridge valve (items .030 and .032). The max. operating pressure is set at the pressure relief valve, which is built into the control cover (item .032) as a pilot valve. When the directional valve (item .034) is at rest the 2-way cartridge valve (item .030) is open and the pump only delivers oil against the closing spring to tank of the valve.

Press force remote control - X3

The press force may be separately set by means of a remote control valve which is connected to port X3.

Control of direction of the press ram

Items .080 and .081 act as an inlet valve for the process "pressing".

Items .070 and .071 act as an inlet valve for lifting (return) of the plunger to its initial position.

Directional valve (item .020 – Symbol "M") ensures that the inlet valve for pressing and return is kept closed. It is therefore possible to connect several press modules to the main pump or have the main pump carry out several auxiliary movements. In this case the pressure control valve (item .030) must be closed by means of energising solenoid Y3.

Rapid traverse – down

By operating the directional valve (item .042-Y.4) the 2-way cartridge valve (item .040) is closed. Oil from the pump is now only able to flow to the rapid traverse cylinders via port X1.

The energising of solenoids Y1 and Y2a cause the pilot oil chamber of the 2-way cartridge valve (item .060) to unload so that oil is able to flow to tank. Max. velocity is set by the stroke limiter on item .061.

Rapid traverse – end

The directional valve (item .042 - Y4) is de-energised dependent on the position of the ram. The 2-way cartridge valve (item .040) opens and connects the rapid traverse cylinders to the main cylinder in order to produce the required force for pressing. Solenoid Y1 is de-energised on the cylinder annulus side, and the 2-way cartridge valve (item .060) is closed with the pressure which was set at pressure relief valve (item .062).

This means that the value of the pressure set determines whether the plunger is decelerated harshly or gently to the press velocity. The deceleration pressure, set at item .062 must be set higher than the holding pressure. The holding pressure including the pressure limit for weight compensation is set at pressure relief valve (item .052).

During the deceleration phase from rapid traverse into press velocity the 2-way cartridge valve (item .060) is closed. Dependent on the increasing deceleration pressure and the unloading of the pilot oil chamber via item .052, the 2-way cartridge valve (item .050) opens without spool overlap occurring.

Pressing

The cylinder carries out the pressing stroke under pressure due to the pressure relief valve (item .052). The max. press velocity is set by the stroke limit of item .051, except in the case of module, size 20 where it is set by the throttle of item .050.

Decompression

After pressing has been carried out, decompression of the system takes place by means of the 2-way cartridge valve (items .090 and .091). The decompression time is set by the stroke limit of the control cover (item .091).

Return

During return (switching of Y2b and Y3) oil flows from the piston chambers of the rapid traverse cylinders via the 2-way cartridge valve (item .040) to the press cylinder and then via the prefill valve to tank.

Pressure relief valve (item .100) used for limiting the annulus pressure is set 10% higher than the max. operating pressure and wire locked.

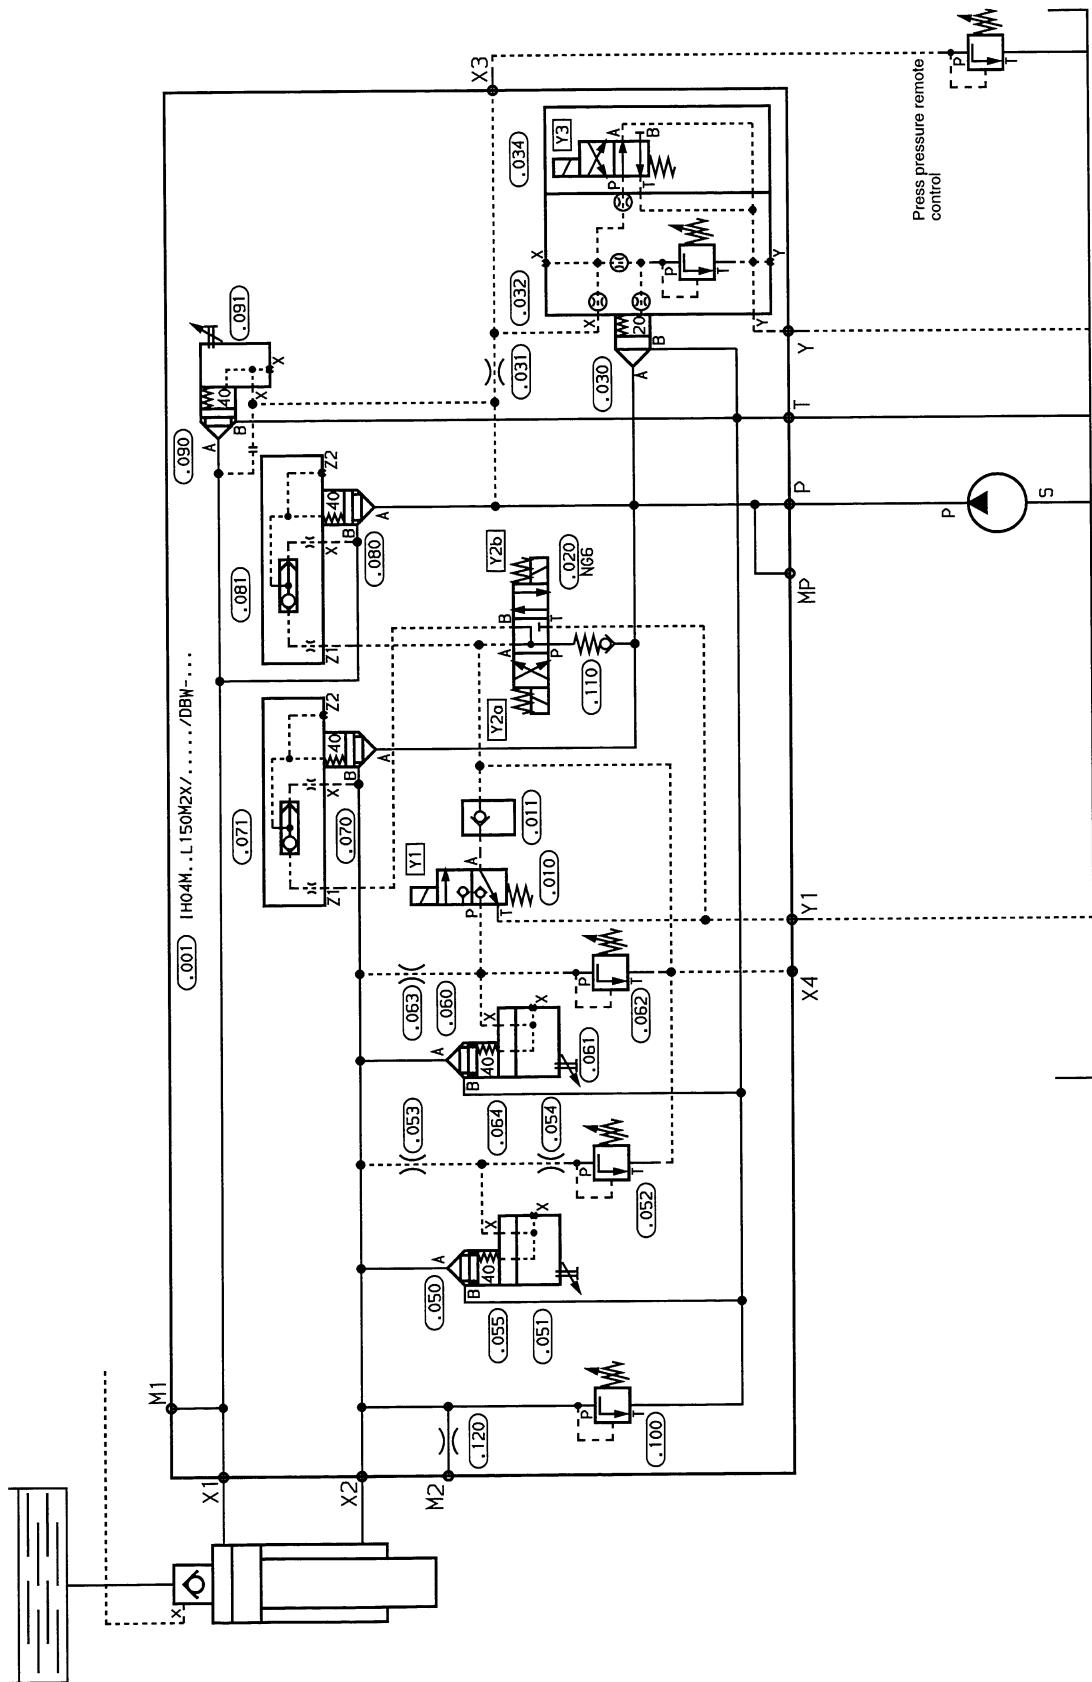

Port X4 is normally closed. If no pilot pump is available, the prefill valve may be controlled via X4.

If the return pressure is allowed to be higher than the pressing pressure set at the remote control valve, then (and only then) is the tank line of the remote control valve connected to port X4.

Pressure relief valve	Y2b	.034							
Directional valve	Y3	.042							
	Y4								

Example for sizes 20 to 100

Press module
Circuit type L

Description and function of valves in press module ...L150M2X/...,**Size 20 to 100****Prerequisite for application**

- Rapid approach under weight of parts,
- Minimum holding pressure 15 bar,
- In this module the valves for the annulus of the cylinder (X2) are leak free, i.e. with no pressure the cylinder is able to remain stationary at any position without loss of oil.

Pressure limiting of pump and low pressure bypass

The pump is pressure limited by means of the 2-way cartridge valve (items .030 and .032). The max. operating pressure is set at the pressure relief valve, which is built into the control cover (item .032) as a pilot valve. When the directional valve (item .034) is at rest the 2-way cartridge valve (item .030) is open and the pump only delivers oil against the closing spring to tank of the valve.

Press force, remote control - X3

The press force may be separately set by means of a remote control valve which is connected to port X3.

Control of direction of the press ram

Items .080 and .081 act as an inlet valve for the process "pressing".

Items .070 and .071 act as an inlet valve for lifting (return) of the plunger to its initial position.

Directional valve (item .020 – Symbol "M") ensures that the inlet valve for pressing and return is kept closed. It is therefore possible to connect several press modules to the main pump or have the main pump carry out several auxiliary movements. In this case the pressure control valve (item .030) must be closed by means of energising solenoid Y3.

Rapid traverse – down

The energising of solenoids Y1 and Y2a cause the pilot oil chamber of the 2-way cartridge valve (item .060) to unload so that oil is able to flow to tank. Max. velocity is set by the stroke limiter on item .061.

Rapid traverse – end

Solenoid Y1 is de-energised and the 2-way cartridge valve (item .060) is closed with the pressure which was set at the pressure relief valve (item .062). This means that the value of the pressure set determines whether the plunger is decelerated harshly or gently to the press velocity. The deceleration pressure, set at item .062 must be set higher than the holding pressure. The holding pressure including the pressure limit for weight compensation is set at pressure relief valve (item .052).

During the deceleration phase from rapid traverse into press velocity the 2-way cartridge valve (item .060) is closed. Dependent on the increasing deceleration pressure and the unloading of the pilot oil chamber via item .052, the 2-way cartridge valve (item .050) opens without spool overlap occurring.

Pressing

The cylinder carries out the pressing stroke under pressure due to the pressure relief valve (item .052). The max. press velocity is set by the stroke limit of item .051, except in the case of module, size 20 where it is set by the throttle of item .050.

Decompression

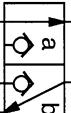

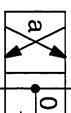

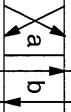

After pressing has been carried out, decompression of the system takes place by means of the 2-way cartridge valve (items .090 and .091). The decompression time is set by the stroke limit of the control cover (item .091).

Return

Energising of solenoids Y2b and Y3. Oil from the piston chamber of the cylinder flows via the prefill valve to tank.

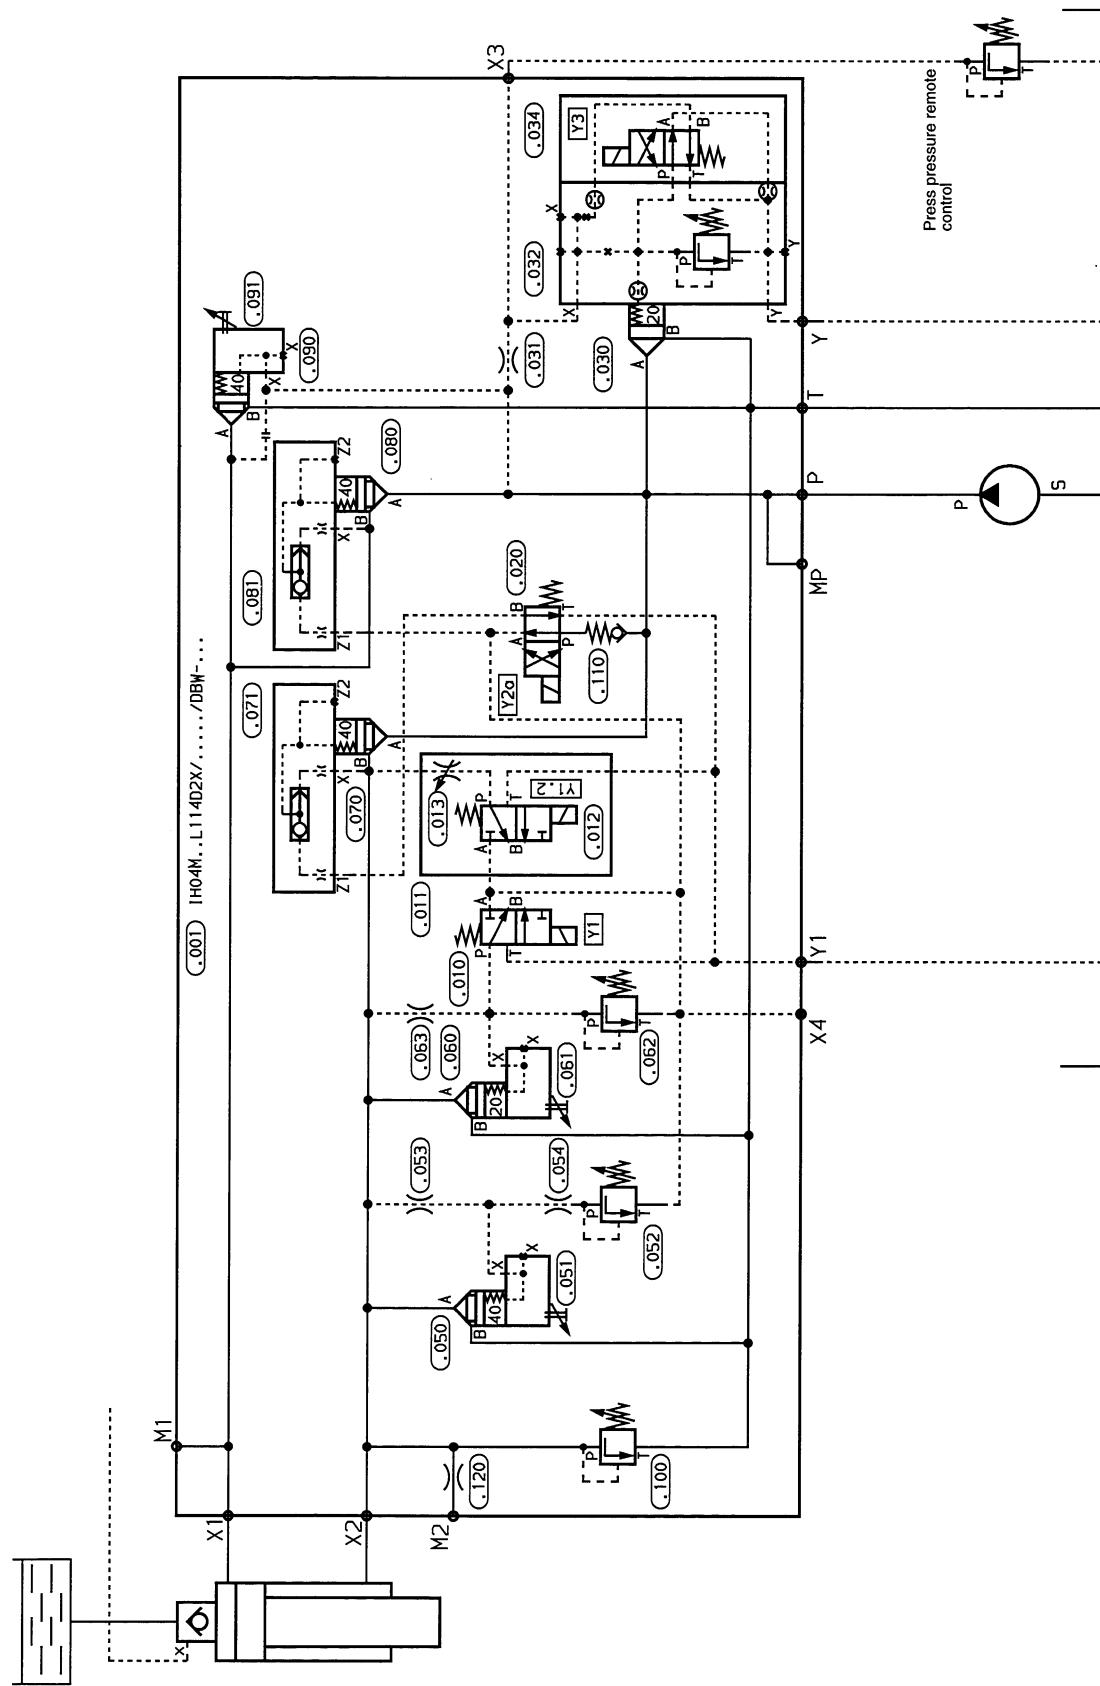

The pressure relief valve (item .100) used for limiting the annulus pressure is set 10% higher than the max. operating pressure and wire locked.

Port X4 is normally closed. If no pilot pump is available, the prefill valve may be controlled via X4. If the return pressure is allowed to be higher than the pressing pressure set at the remote control valve, then (and only then) is the tank line of the remote control valve connected to port X4.

Circuit type L

Description and function of valves in press moduleL114D2X/...,**Size 20 to 100****Prerequisite for application**

- Standard setting for free fall,
- Pressure free,
- Minimum holding pressure min. 15 bar.

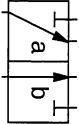

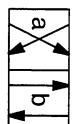

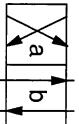

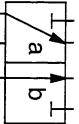

Standard setting

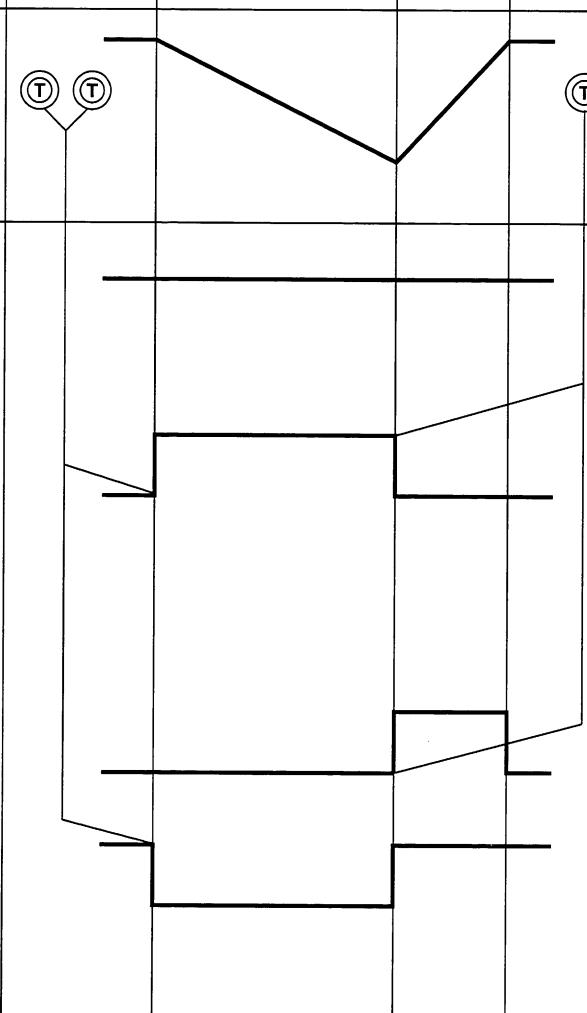

By energising Y1.2 and Y2a the function "setting-up" is started. The velocity is set at throttle valve (item .013).

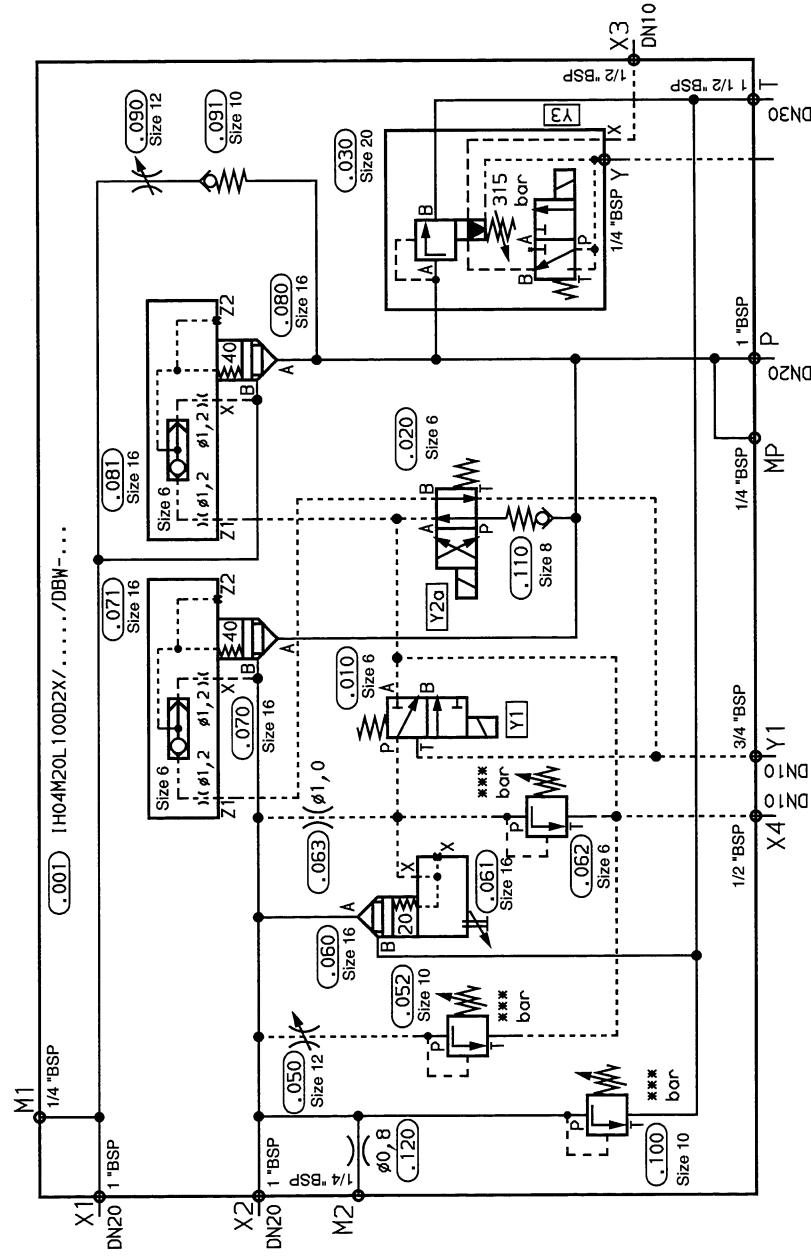

Return

Energising of solenoid Y3 and deenergising of Y2a. The pump delivers oil to the annulus chamber of the cylinder and the press lifts.
The oil from the full bore of the cylinder flows via the prefill valve to tank.

Function diagram: Normal press cycle, modelL114D2X/
